From papers to knowledge: Representing scientific contributions in the Open Research Knowledge Graph

Prof. Dr. Sören Auer Leibniz University of Hannover TIB Technische Informationsbibliothek

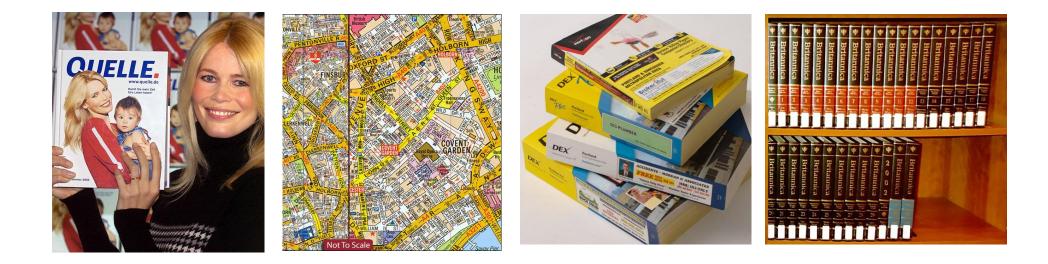

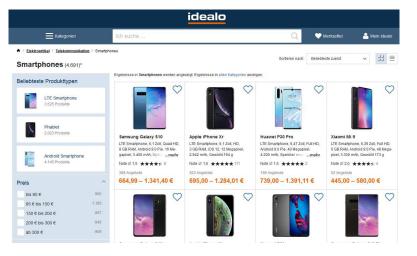

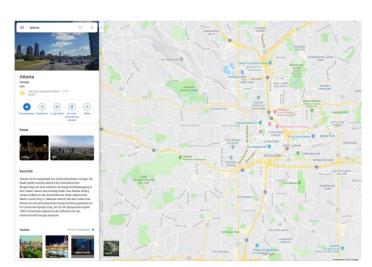

How did information flows change in the digital era?

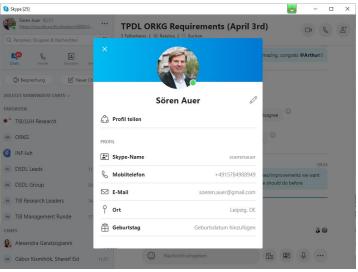

How does it work today?

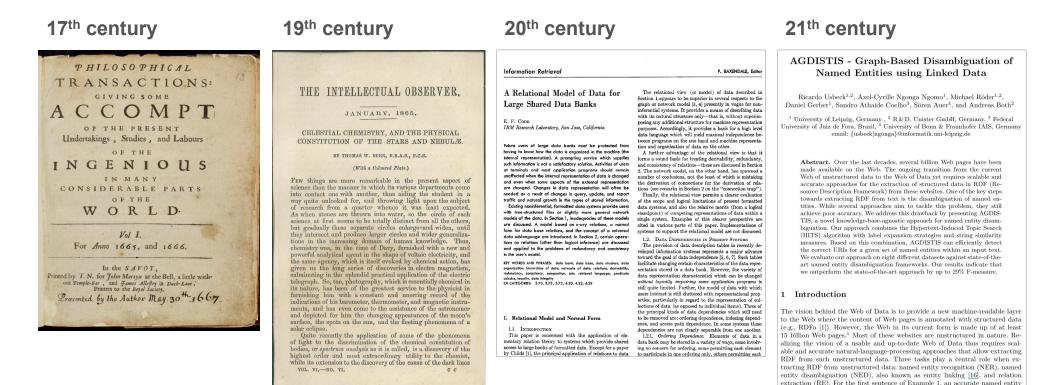

The World of Publishing & Communication has profundely changed

- New means adapted to the new possibilities were developed, e.g. szooming‰dynamics
- " Business models changed completely
- ⁷ More focus on data, interlinking of **data / services and search** in the data
- Integration, crowdsourcing, data curation play an important role

What about Scholarly Communication?

Scholarly Communication has not changed (much)

Meanwhile other information intense domains were completely disrupted: mail order catalogs, street maps, phone books, õ

Page 7

recognition approach would return the strings Barack Obama and Washington, D.C.. A high-quality DBpedia-based named entity disambiguation (NED) approach would use these already recognized named entities and map the strings ¹ Data gathered from http://www.worldwidewebsize.com/ on January 4th, 2014.

ΓΙΒ

We need to rethink the way how research is represented and communicated

Challenges we are facing:

Digitalisation of Science	Monopolisation by commercial actors	Reproducibility Crisis	Proliferation of publications	Deficiency of Peer Review
 Data integration and analysis Digital collaboration 	 Publisher look-in effects Maximization of profits ^[1] 	 Majority of experiments are hard or not reproducible ^[2] 	 Publication output doubled within a decade continues to rise ^[3] 	 Deteriorating quality ^[4] Predatory publishing

Reproducibility Crisis

1,500 scientists lift the lid on reproducibility

Monya Baker in *Nature,* 2016. **533** (7604): 452. 454. doi:10.1038/533452a:

- 70% failed to reproduce at least one other scientist's experiment
- 50% failed to reproduce one of their own experiments

Failure to reproduce results among disciplines

(in brackets own results)

chemistry	87%	(64%)
biology	77%	(60%)
physics and engineering	69%	(51%)
Earth sciences	64%	(41%)

Duplication and Inefficiency

How can we avoid duplication if the terminology, research problems, approaches, methods, characteristics, evaluations, õ are not properly defined and identified?

How would you build an engine / building without properly defining their parts, relationships, materials, characteristics õ ?

Page 11

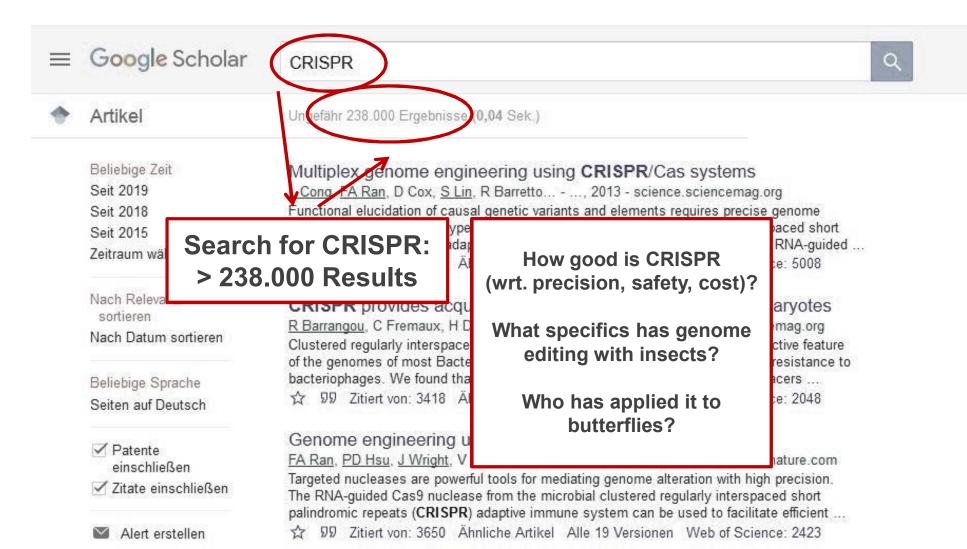

Root Cause – Deficiency of Scholarly Communication?

Lack of...

Transparency	Integratability	Machine assistance
information is hidden in text	fitting different research results together	unstructured content is hard to process
Identifyability	Collaboration	Overview
of concepts beyond metadata	one brain barrier	Scientists look for the needle in the haystack

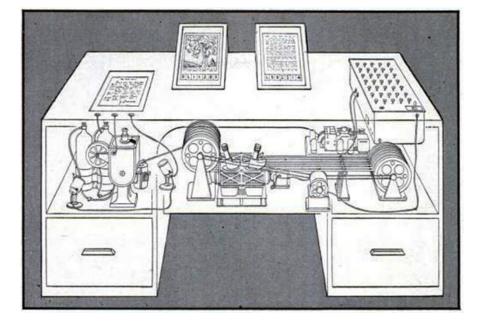

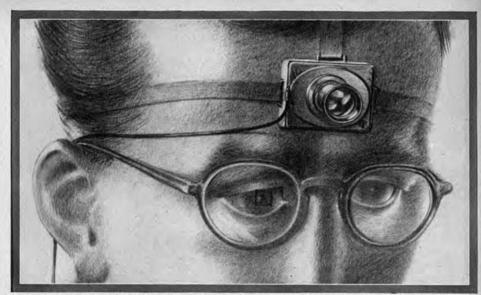

How can we fix it?

Page 15

Realizing Vannevar Bush's vision of Memex

Source: http://photos1.blogger.com/blogger/5874/1071/1600/Memex.jpg

A SCIENTIST OF THE FUTURE RECORDS EXPERIMENTS WITH A TINY CAMERA RITED WITH UNIVERSAL-FOCUS LENS. THE SMALL SQUARE IN THE EVECLASS AT THE LEFT SIGHTS THE OBJECT

AS WE MAY THINK A TOP U.S. SCIENTIST FORESEES A POSSIBLE FUTURE WORLD IN WHICH MAN-MADE MACHINES WILL START TO THINK by VANNEVAR BUSH

DIRECTOR OF THE OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT Condensed from the Atlantic Monthly, July 1945

This has not been a scientists' war; it has been a war in which all have had a part. The scientists, burying their old professional competition in the demand of a common cause, have shared greatly and learned much. It has been exhilarating to work in effective partnership. What are the scientists to do next?

For the biologists, and particularly for the medical scientists, there can be little indecision, for their war work has hardly required them to leave the old paths. Many indeed have been able to carry on their war research in their familiar peacetime laboratories. Their objectives remain much the same.

It is the physicists who have been thrown most violently off stride, who have left academic pursuits for the making of strange destructive galgets, who have had to devise new methods for their unanticipated assignments. They have done their ear on the devices the make is reached to the terms.

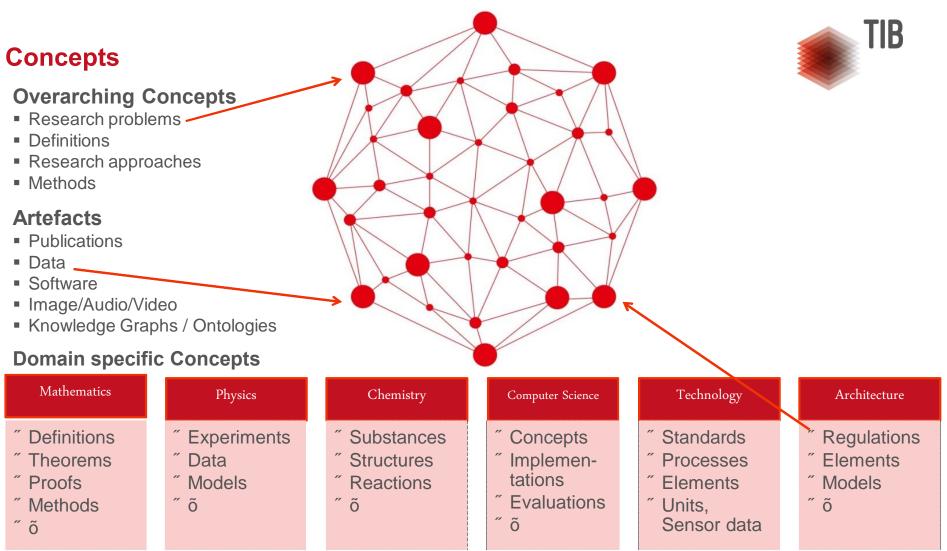

Source: http://tntindex.blogspot.com/2014/10/tabletalk-vannevar-bushs-memex.html

been part of a great team. Now one asks where they will find objectives Publication has been extended far beyond our present ability to make real

ress, and the effort to bridge between disciplines is correspondingly superficial.

Professionally our methods of transmitting and reviewing the results of research are generations old and by now are totally inadequate for their purpose. If the aggregate time spent in writing scholarly works and in reading them could be evaluated, the ratio between these amounts of time might well be startling. Those who conscientiously attempt to keep abreast of current thought, even in restricted fields, by close and continuous reading might well shy away from an examination calculated to show how much of the pre-vious month's efforts could be produced on call.

Mendel's concept of the laws of genetics was lost to the world for a gen eration because his publication did not reach the few who were capable of another and established of another source of the sourc ficant attainments become lost in the mas

Page 17

Linked Data Principles

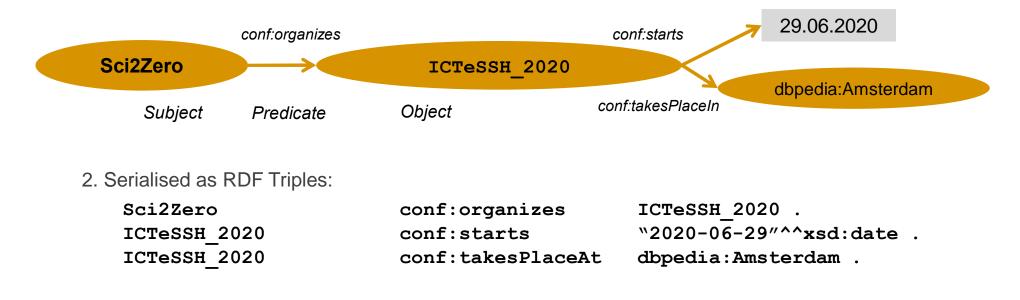

Addressing the neglected third V (Variety)

- 1. Use URIs to identify the %bings+in your data
- 2. Use http:// URIs so people (and machines) can look them up on the web
- 3. When a URI is looked up, return a description of the thing in the W3C Resource Description Format (RDF)
- 4. Include links to related things

http://www.w3.org/DesignIssues/LinkedData.html

RDF & Linked Data in a Nutshell

1. Graph based RDF data model consisting of S-P-O statements (facts)

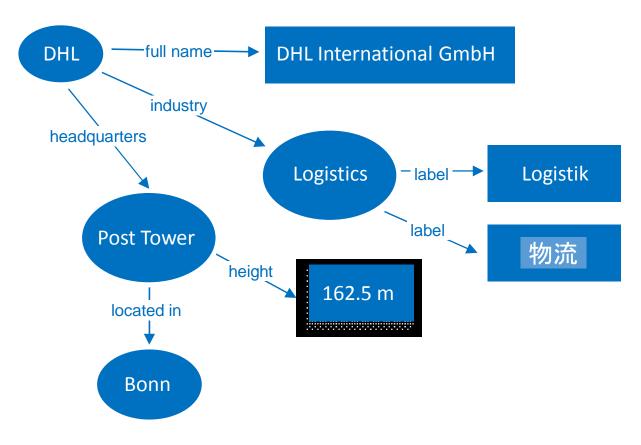

3. Publication under URL in Web, Intranet, Extranet

TIB

Linked Data

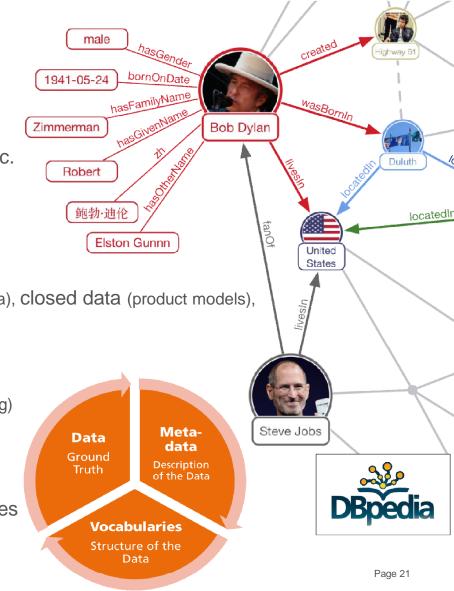

Creating Knowledge Graphs with RDF

Page 20

Knowledge Graphs – A definition

- Fabric of concept, class, property, relationships, entity desc.
- Uses a knowledge representation formalism (RDF, OWL)
- Holistic knowledge (multi-domain, source, granularity):
 - instance data (ground truth),
 - open (e.g. DBpedia, WikiData), private (e.g. supply chain data), closed data (product models),
 - derived, aggregated data,
 - schema data (vocabularies, ontologies)
 - meta-data (e.g. provenance, versioning, documentation licensing)
 - comprehensive taxonomies to categorize entities
 - links between internal and external data
 - mappings to data stored in other systems and databases

Exploration and Question Answering

Research Challenge:

- Intuitive exploration leveraging the rich semantic representations
- " Answer natural language questions

 K. Singh, S. Auer et al: <u>Why Reinvent</u> <u>the Wheel? Let's Build Question</u> <u>Answering Systems Together.</u> The Web Conference (WWW 2018).

Result: Automatic Generation of Comparisons / Surveys

Q: How do different genome editing techniques compare?

Engineered Nucleases	Site-specificity	Safety	Ease-of-use / costs/ speed
zinc finger nucleases (ZFN)	++ 9-18nt	+	 \$\$\$: screening, testing to define efficiency
transcription activator-like effector nucleases (TALENs)	+++ 9-16nt	++	++ Easy to engineer 1 week / few hundred dollar
engineered meganucleases	+++ 12-40 nt	0	 \$\$\$ Protein engineering, high-throughput screening
CRISPR system/cas9	++ 5-12 nt	-	+++ Easy to engineer few days / less 200 dollar

Conclusions

- We need to reinvent scholarly communication
- Knowledge Graphs are perfectly suited to capture research contributions in a structured and semantic way making them human and machine interpretable
- With our Open Research Knowledge Graph initiative we aim to establish a registry for research contributions
- Curation and synergistic combination of human, expert and machine intelligence is a challenge
